Rulebook

Pocket Paladin

Prologue

Epic adventure awaits in this micro solo game! Choose your hero and scenario and set forth to conquer the enemy's castle. Cross the landscape, learn new skills, gain allies, and interact with map sites like monsters, mages, storms, towns, and tunnels. Reach and defeat the enemy's castle in time and you have saved Lorehelm from the encroaching evil…for now.

Cutting the Cover Mat

The cover mat is oversized due to component restrictions on The Game Crafter. You need to cut it along the dotted line provided.

Components

1 Hero Token

1Tracks Card

1 Ability Card

2 Map Cards

4 Reference Cards

16 Enemy Tokens (fronts)
16 Ally & Skill Tokens (backs)

3 Crystal Tracker Shards
1 Crystal Source Shard

5 Markers

Cover Mat (outside) and Bonus Map (inside)

Single-Sleeve Storage

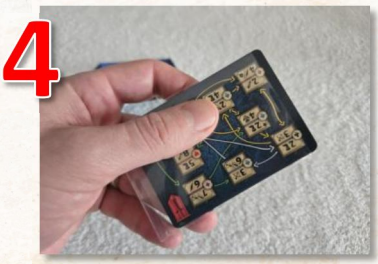

Pocket Paladin does not come with a box or a physical rulebook. This is in part to save the customer money (boxes and rulebooks are expensive components!). But it's also because I had a unique vision for this game: I wanted you to be able to carry it in your wallet. All essential components for Pocket Paladin will fit into a single card sleeve, with the optional reference cards in a second sleeve. A firm sleeve may not work for this. I recommend using a soft (and typically cheaper) sleeve, such as Ultra Pro penny sleeves. To store the game:

1. Lay the cards on the table. Put a single layer of tokens and shards on top of 2 of the cards.
2. Place the remaining 2 cards on top of those cards.
3. Stack one of those piles on top of the other to make a single stack.
4. Carefully slide the entire stack into a soft card sleeve.
5. Slide the cover mat into the sleeve, its two short edges around the outside cards. This prevents the tokens and shards from falling out.
6. Slide the reference cards into a separate card sleeve.

Gameplay Overview

Pocket Paladin is played in turns and rounds. A round consists of up to 6 turns, but may be fewer turns if your hero is wounded. You have a limited number of rounds to reach and defeat the enemy castle.

Most of what you do in the game you accomplish using your Ability Card, advancing your Ability marker and using up to 3 Abilities per turn. A typical turn includes using Abilities, Skills and Allies to help you move into a map hex and interact with a site it contains. Sites include monsters and mages you must fight, storms you must navigate, and towns or caravans you can interact with to do things like heal, recruit Allies and buy Crystals.

Your chosen difficulty setting determines your round limit. Each round is either a **day round** or a **night round**. Each round is thematically half a day.

You win if you reach and defeat the enemy castle before time runs out!

Difficulty Settings

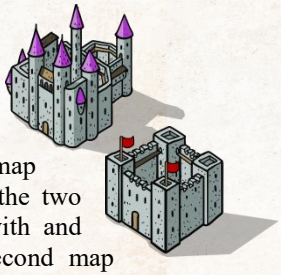

Before setting up your game, choose which difficulty setting you want. It will affect your round limit and the type and number of enemies you face at the castle. For your first game, we recommend playing on the easy difficulty setting.

- **Casual**
  - **Time Limit:** 6 rounds
  - **Castle:** 2 tower enemies
- **Easy**
  - **Time Limit:** 5 rounds
  - **Castle:** 2 tower enemies and 1 wandering enemy
- **Normal**
  - **Time Limit:** 4 rounds
  - **Castle:** 3 tower enemies
- **Hard**
  - **Time Limit:** 4 rounds
  - **Castle:** 3 tower enemies and 1 wandering enemy
- **Expert**
  - **Time Limit:** 3 rounds
  - **Castle:** 3 tower enemies
- **Impossible**
  - **Time Limit:** 3 rounds
  - **Castle:** 4 tower enemies

Setup

Follow along with the graphic on **page 8** to help as you set up the game.

1. Randomly select a map card to be your starting map and position it in front of you with the side containing the castle (*see right*) face down and the three partial hexes closest to you. Position the other map card (also castle side face down) so that the two partial hexes on the starting map align with and overlap the bottom two hexes on the second map placed.

Bonus Map: *After you have played the game a few times, you may want to experience more variety and broaden the landscape by using the Bonus Map. See the Bonus Map variant on* ***page 35*** *to learn how this works.*

2. Select your hero. The red paladin is on one side of the hero token and the purple paladin on the other. In addition to your hero token, collect the Ability Card and Tracks Card, flipping each to the side with your Paladin's banner color. For your first game, we recommend using the red paladin.

3. Place your hero token on one of the three partial hexes closest to you.

4. Place your Ability Card to the right of the map. Place the largest marker on the Ability square marked with a star ★ in the top-left corner.

5. Place the 3 Crystal Tracker Shards above your Ability Card and set them each to **0**. Place the Source Shard between your Ability Card and the Map.

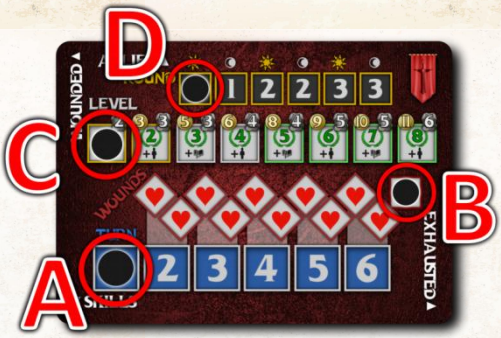

6. Shuffle the enemy tokens and divide them into two stacks: **monsters** (red) and **mages** (purple). Place these stacks north of your map cards, leaving room for the Offer (*see next step*).

7. Populate the map cards with wandering enemies by placing a **monster** enemy on all map spaces with red banners (*left*) and a **mage** enemy on all map spaces with purple banners (*right*).

8. Create the Offer by flipping over the top token of the monster or mage stack that currently has the most tokens (if tied, you may choose). Do this three times to reveal 3 offer tokens.

9. Place your Tracks Card to the left of the map with markers on…
   - **A.** The 1 space of the turn limit track
   - **B.** The empty heart space (rightmost) of the wound track.
     a) NOTE: For the wound track, use the marker that has a red side in addition to a black side.
   - **C.** The Level 1 space (leftmost) on the Level track
   - **D.** On the leftmost space of the Round track

10. Look at the benefit icon on the Level 1 space of your Level track. If the benefit is an Ally slot, you start the game with room to recruit 1 Ally during your travels (*see Allies on* ***page 17***). If it is a Skill , immediately choose a Skill to gain from the Offer, replacing the empty Offer space after doing so. Place the Skill below your Tracks Card, in the Skills area (TIP: you can position this so just the Skill area of the token is showing -- *see below*).

11.

See completed set up below. Note that this is setup for the red paladin, which means you'll see the red banners on the Tracks and Ability cards, the red paladin's hero token, and a starting skill tucked below the Tracks Card.

How to Win: Defeat the Castle

To win Pocket Paladin, you must reach the enemy castle and defeat its defenders before time runs out. Thus, you will always want to be conscious of moving Northward on your adventures. You need to level up your hero throughout your journey to stand a chance against the powerful enemies defending the castle. A winning strategy balances haste (so you don't run out of time) and interacting with map sites (so you can earn XP to level up).

Important Concepts

A few concepts will be helpful to understand before learning the rest of game.

Rounds, Turns, Actions, Abilities & Points

Each of these concepts will be explained in more detail later, but for now it's important to have an introduction to how they relate to each other.

Pocket Paladin is played over multiple **Rounds**, with a different Round limit depending on your chosen difficulty setting. Each Round is made up of multiple **Turns** (a maximum of 6, but sometimes less depending on how many wounds you have). During each Turn, you will take **Actions** (movement, combat, etc.). And finally, every Action you take will be powered by **Abilities** (typically 1 to 3 Abilities per Action) or, sometimes, Skills or Allies. Abilities are on the squares connected by arrows on your Ability Card. Abilities generate **Points**, which dictate the effectiveness of your Actions. You are only allowed to use a maximum of 3 Abilities per Turn, but you can combine multiple Abilities of the same type to generate more Points.

Note that Abilities are not the *only* thing that can power your Actions. **Allies** and **Skills** may also contribute.

Crystals and the Source

Crystals are resources you can spend to use more powerful actions. There are 3 crystal colors, shown below: Black (clubs icon, *left*), Blue (spades icon, *middle*), and Purple (diamonds icon, *right*).

You track how many Crystals you have on the Crystal Tracking Shards, shown below.

You start the game with 0 Crystals. When you gain a Crystal, rotate the appropriate Shard to reflect the increase. When you spend a Crystal, rotate the appropriate Shard to reflect the decrease. There is no limit to how long you can keep Crystals. You may only ever have a maximum of 5 Crystals of each color.

The Crystal Source Shard (known as simply *the Source*) provides a Crystal you can use for free once per turn. During setup -- and after turns you used the Source Crystal -- you "roll" the Source Shard to randomly decide which Crystal options will be in the Source next turn. "Roll" the Shard by shaking it up in your hands and casting it on the table, or by flipping it like a coin. Whichever edge of the shard is most oriented upright shows you which Crystal options are available to be used.

Note that some orientations of the Source Shard have 2 Crystal types shown, separated by a "/". This means you have your choice of the 2 to use on your turn.

Do not automatically reroll the Source Shard if you didn't use a Crystal from it on your turn. Don't reroll the Source Shard until the Turn Cleanup Phase.

It is recommended that when the Source Crystal is available, you place the Soure Shard on the left side of your Ability Card, as shown during setup. After using the Source Crystal, move the Shard to the right side of the Ability Card to remember this. When you reroll it for next turn, once again place it on the left side of the Ability Card.

Choosing Random Tokens

Sometimes the rules will ask you to choose a random enemy token of a given type (Monster/red or Mage/purple). To choose a random token, mix up the appropriate token stack and choose one without looking.

Alternatively, I like to leave the tokens in their stacks and simply avoid looking at the top tokens in detail. Then, I just grab the top token of the appropriate stack when I need a random one. I find this easier than shuffling up the tokens every time.

Rounds

You have a limited number of rounds (dictated by your difficulty setting) to reach and defeat the castle. Each Round is thematically half a 24-hour day, and every round is either a Day Round or a Night Round.

A Round consists of multiple Turns. You keep taking Turns until the Round ends, after which you perform Round cleanup and start the next Round.

Rounds have 2 stages:

1. **Turns Stage**, in which you take multiple turns.

2. **Round Cleanup Stage**, which prepares you for the next round.

Turns Stage

The Turns Stage of the Round consists of you taking multiple Turns until the Round ends and you perform cleanup during the Round Cleanup Stage. After that, a new Round begins and you repeat the process.

Your Turn is made up of 2 phases. Complete both phases every turn, in this order:

1. **Action Phase**, in which you'll use **Abilities** to perform **Actions,** as well as activate **Skills** and **Allies**.

2. **Turn Cleanup Phase**, which prepares you for the next Turn.

ACTION PHASE

During the **Action Phase**, you can take any number of **Actions** that you can or want to. You take most **Actions** by using **Abilities** to generate some number of **Points** of one of the game's Point types, and then spending those Points on the Action.

First, we'll explain how to generate Points. Then, we'll go through the different Actions you can take on your Turn, most of which require you to spend some number of Points.

GENERATING AND SPENDING POINTS

There are 4 Point types (some have multiple subtypes). The Point types and subtypes are noted below.

- Movement 
- Influence 
- Attack (4 subtypes)
  - Physical Melee Attack 
  - Physical Ranged Attack 
  - Magic Melee Attack 
  - Magic Ranged Attack 
- Block (2 subtypes)
  - Physical Block 
  - Magic Block 

Think of Points as temporary currency that you generate so you can immediately spend them on an Action. For example, you might generate 4 movement Points so you can move into an enemy's hex. Then you might generate 5 block Points to block the enemy's attack, and then 4 attack Points to defeat the enemy.

There is no physical means for tracking the Points you generate and spend. You don't need to remember them for long. You only generate Points to complete the current Action, and any unspent Points are lost immediately after the Action is completed.

How Long are Points Stored?

The Points you generate are stored until…

- You spend them.
- You decide to generate a different Point type, or take an Action that requires you to spend a different Point type.
- Your turn ends.

For example, let's say you generate 6 movement Points. You spend 2 of these movement Points to move into a grassland hex, which means you have 4 remaining. Then you decide to interact with a town on that new hex, so you use an Ability to generate 2 influence Points. This causes your 4 remaining movement Points to be lost.

If you had instead decided to skip interacting with the town and kept moving, you could have spent your remaining 4 movement Points to move into, say, an adjacent wasteland hex. That would have brought your remaining movement Points down to zero. You would need to generate more movement Points if you wanted to take another move Action.

NOTE: As shorthand, this rulebook and reference material may simply refer to Points as the Point type. For example, instead of saying, "Spend 4 movement Points" this rulebook may simply say, "Spend 4 movement".

Ways to Generate Points

There are 3 ways to generate Points.

1. Use an Ability (*most common*)
2. Use an Ally
3. Use a Skill

You can use a combination of the above methods for Point generation for a single Action. For example, you could use an Ability to generate 2 movement and use an Ally to generate 4 movement, and then spend that 6 total movement on move Action.

Likewise, you can use multiple of the same method to generate Points for a single Action. For example, you could use 2 consecutive Abilities to generate 2 and 4 movement, for a total of 6 movement. Or, you could use 2 Allies to generate 2 and 3 attack, for a total of 5 attack.

Abilities

Abilities are the heart and soul of Pocket Paladin. Abilities are found in the Ability squares on your Ability Card. Most of what you do on your Turn will be deciding how to best use Abilities during your Turn to accomplish the Actions you want to take.

Each Ability square has two Abilities on it: a top Ability and a bottom Ability. You can use the top Ability **for free**, or the bottom Ability **for a cost**. When you use an Ability, you get to use just one of the two options in the Ability square. The top-half Ability is the square's **basic** Ability, and the bottom-half Ability is the square's **boosted** Ability.

Using Abilities

You can use up to 3 Abilities per Turn. You are allowed to use as few as zero if desired.

You use an Ability by advancing your Ability marker from its existing Ability square to a different Ability square connected by an arrow. The arrow must point from the marker's current square to the destination square. The Ability square you moved the marker to is the one you get to use an Ability from.

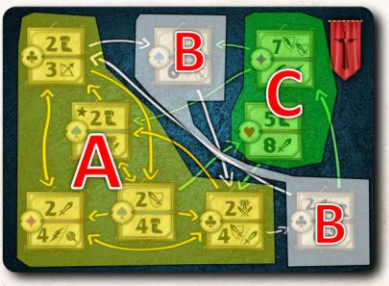

Each Ability square is connected to one (or more) other squares by colored arrows. You can only move to Ability squares via arrows that match the color of a hero Level you have already reached.

Each hero Level on has a colored border; either yellow, white or green. As you increase your hero Level, you'll move the Level marker rightward. As soon as you reach a white-bordered Level, you have unlocked access to the white arrows on the Ability Card. When you reach a green-bordered Level, you have unlocked access to green arrows on the Ability Card.

As you can see from the image on the next page at the start of the game you only have access to Ability squares connected by yellow arrows **(A)**. When you reach the third hero Level, you unlock the Ability squares connected by white arrows **(B)** in addition to the yellow ones you already had access to. When you reach the fifth hero Level, you unlock access to Ability Squares connected by green arrows **(C)** and can now use all Ability squares on the card.

Note that this example is showing the red Paladin's Tracks and Ability Cards, but the same principle applies to the purple Paladin's cards. Just pay attention to which arrow colors you have unlocked to see which Ability squares you have access to.

When you use an Ability, whether the basic (top) half of the square, or its boosted (bottom) half, it means you have generated that many Points of the type indicated.

For example, if you use an Ability that provides **2** , it means you have generated **2 movement Points**.

Each Ability square has a basic Ability (the top half) and a boosted Ability (the bottom half), separated by a colored divider. On the left side of the Ability square is the icon of one of the 3 Crystals. The Ability square pictured on the right, for example, is boosted with a blue Crystal.

You can use an Ability square's basic Ability for free. You can use its more powerful boosted Ability by spending a Crystal of the appropriate color, either from the Source or by spending a stored Crystal from the matching Crystal Tracker Shard.

Special Abilities

Some Abilities have unique Ability effects. They are explained here.

An Ability with a slash (/) between two icons means you must choose which of those options to use the Ability for. In the Ability shown on the left, you have the choice of whether to use this Ability for 4 Physical Block or 4 Physical Melee Attack.

If a red is Heart pictured instead of one of the 3 Crystal colors, it means you must take 1 wound to use the boosted Ability in this square.

If the Precision icon is shown on an Ability, it means you can use this Ability to give your ranged attacks Precision this turn. Note that using this Ability does use up on of your 3 Ability uses for your turn. Note that in the Ability shown on the left, you can choose between generating 4 Magic Melee Attack, or adding Precision to your ranged attacks.

If the Crystallize icon ( ) is shown, it means you can

use this Ability to store the denoted number of Crystals (1) from the Source. This uses up the Crystal from the Source this turn, but you reroll the Source Shard as normal so there is a Crystal in the Source next turn.

Combining Abilities

As you are generating Points to carry out an Action, you are allowed to combine **consecutive** Abilities you use towards the same Action. An Abilities are considered consecutive if they are connected directly by an arrow (with no abilities in between).

For example, if you use an Ability that generates 2 movement Points and from there immediately use a different Ability that generates 4 movement Points, you can use that total of 6 movement Points toward the same Action.

You are **not** allowed to combine **non-consecutive** Abilities toward the same Action. If in the above example you had used an Ability that generated influence Points in between the two movement-generating Abilities, you could not use those two movement-generating Abilities toward the same Action.

Note that you will learn there are different attack and block types (physical and magic), as well as different attack ranges (ranged and melee). You are allowed to combine consecutive attack abilities of any type. Likewise, you are allowed to combine consecutive block abilities of any type.

For example, you could use an Ability that generates 2 physical block Points, and next use an Ability that generates 4 magic block Points. These could be considered consecutive abilities and combined for blocking a single enemy, even though they are different types of block.

Standard Point Types

Instead of using an Ability for its printed value, you can use it to generate 1 Point of your choice of the 4 standard Point types.

The standard Point types are:

- Movement 
- Physical Block 
- Physical Melee Attack 
- Influence 

Using an Ability for a standard 1 physical melee attack or a standard physical block can be combined for attacking and blocking respectively. It does not break the consecutive chain if you are trying to combine multiple Abilities together of the same type.

Allies

Allies are companions you can recruit to help you on your adventure. Allies exist on the opposite face of the Enemy Tokens, and on the top half of that face (the various Skills are on the bottom half). Allies have their image on the very top. Below their image is the Ally's 3 stats. From left to right Recruitment Cost **(A)**, Effect **(B)**, HP **(C)**.

The **Recruitment Cost (A)** is how much Influence you must spend to recruit the ally. You can recruit allies at specific Sites, namely Towns and Caravans. When you recruit an Ally, choose from among the Allies currently in the Offer (refill the Offer back up to 3 Allies after your turn in the same way you populated the Offer during setup). After recruiting an Ally, put it above your Tracks Card. You can optionally tuck the bottom part of the Ally token underneath your Tracks Card to cover everything except the Ally's information. The Ally in the example image has a Recruitment Cost of 8 Influence.

You can recruit as many Allies as you can afford, but you can only keep as many Allies as you have capacity for. Your Ally capacity is the sum of all Ally capacity icons ( ) present on your current Level and all Levels below it. You can choose to replace existing Allies with new Allies you recruit, even if the Ally you replace is exhausted or wounded (newly recruited Allies always join you *ready* (unexhausted) and unwounded). Replaced Allies are placed at the bottom of the appropriate Enemy stack.

The Ally's **Effect (B)** is what you can exhaust them to generate. At any time on your turn, you can exhaust an ally by moving them to the right side of your Tracks Card. (Note that exhausted Skills will also go to this area, so keep exhausted allies near the top half of the card and exhausted skills near the bottom half so you don't confuse them). Exhausting an Ally in this way generates Points as shown by their Effect. Ally Effects are colored red or purple to help show whether it generates Physical (red) or Magic (purple) Points, but you can also see this simply from the Effect's icon. The Ally in the example image has an Effect of generating 7 Physical Melee Attack.

You cannot use an Exhausted Ally for its Effect again this round. Exhausted Allies are readied (unexhausted) during Round Cleanup, so you get to use them again next round. Even though you can't use them for their Effects, exhausted Allies can still be wounded.

The Ally's **HP (C)** is how much Enemy damage they can soak when wounded (see Wounding Allies on **page 28**). The Ally in the example image has an HP of 6.

Skills

Skills are special abilities you earn when you reach certain hero Levels. Skills are found in the bottom section of the Ally/Skill tokens, on the opposite face of all Enemy tokens.

When you increase your Level and see the skill capacity icon ( ), you immediately gain a Skill. (Note that the red Paladin begins the game with a Skill because her starting Level already has a skill capacity icon).

When you gain a Skill, choose a skill token from the Offer and place it below your Tracks Card. You may optionally tuck the top part of the token underneath your Tracks Card to cover the Ally information.

Each Skill has a different effect, represented with icons. You can see descriptions of each Skill's effect on **page 39**, as well as on the reference cards provided with the game.

Some Skills have passive effects that give you a benefit that is always in play.

Some Skills require you to exhaust them to be used (shown with). To use a Skill with an exhaust cost, the Skill must be ready, which means it is below your Tracks Card. You exhaust a Skill by moving it to the right side of your Tracks Card, keeping it closer to the bottom half of the card so you don't confuse the token with exhausted Allies. Exhausted Skills cannot be used again, but you ready all exhausted Skills during Round Cleanup, so you'll get to use them again next round.

Some Skills require you to spend an Ability to use (shown with). Using one of these Skills requires you to give up one of the 3 Abilities for your turn. In other words, if you use one of these Skills on your turn, you

can only use 2 Abilities instead of your normal 3 this turn. You must have one of your Abilities remaining in order to use one of these skills (you can't use one if you've already used your 3 Abilities this turn). You do not need to exhaust Skills with this type of cost.

Some Skills are free to use, but can only be used once per turn (shown with 1:). You do not need to exhaust these Skills to use them.

TAKING ACTIONS

On your Turn, you can take as many Actions as you can or want to. There are many different Actions you can take, but most of the time you will be either moving or interacting with a map site.

You take most Actions by generating and spending Points. Remember that you can generate Points with a combination of using Abilities, Skills and Allies (and remember you can use a maximum of 3 Abilities per turn!).

Below are the different Actions you can take and how to resolve them.

Move

Move Actions are how your hero gets from one place to another. To take a move Action, carry out the following steps:

1. Generate movement Points.

2. Spend those movement Points to move your hero token into an adjacent hex, reducing your stored movement Points by the movement cost of the hex you entered. The cost to move into a hex is based on terrain type. Terrain types are explained in the next section.

3. Continue moving until you choose to stop or cannot move any further, or until you move into a hex with a **required site**. **Optional sites** do not force you to stop movement or interact with the site. The different sites and whether they are optional or required are listed beginning on **page 21**.

Exploring

When you have reached one of the Northern-most full hexes on the Northern-most map card, your hero will be adjacent to one of the half

hexes along the card's Northern border. Before moving any further, you must Explore.

To Explore, you must spend 2 Movement while your hero token is in one of the last full hexes along the Northern border of the second map card. After spending this Movement, flip over the first map card (bottom-most map card) and place it North of the map card your hero is currently on. The card you flipped is now showing one of the two Castles. Tuck this card underneath the previous map card so the partial hexes on the previous map card line up and connect with the card you just placed.
If there are any tokens on the map card you need to flip and reposition, discard these tokens to the bottom of their respective Enemy stacks.

After placing the Castle map card, populate the card with any Wandering Monster or Mage tokens as needed.

If after spending the 2 Movement to Explore you have any Movement Points still stored, you may now spend these to continue moving if desired.

Terrain Types

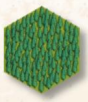

There are 7 types of terrain, each with different costs to move into. These are shown below. You will notice that some terrain types have different movement costs depending on whether it is a day or night Round. Some terrain types you cannot move into, unless you have an effect that breaks this rule (such as some Skills). The terrain movement costs are also shown on one of the reference cards for convenience.

Grassland: 2 movement cost

Hills: 3 movement cost

Forest: 3 movement cost during the day. 5 movement cost at night.

Desert: 3 movement cost at night. 5 movement cost during the day.

Wasteland: 4 movement cost

Mountains: You may not move into mountains.

Lake: You may not move into lakes.

Discovering Tower Enemies

Unlike Wandering Enemies, Tower Enemy tokens are not placed on the map automatically during setup or when a new map card with Tower Enemy sites is revealed. Instead, you reveal them as you get close to them--but depending on whether it is a Day or Night.

If it is a Day Round, place the appropriate type of enemy token as soon as you move into a hex adjacent to a hex with a Monster or Mage Tower.

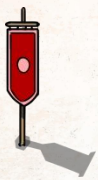

If it is a Night Round, you only reveal Tower Enemies after you move in to the Tower's hex. You therefore must immediately enter combat with the token after revealing it.

Regardless if it is a Day or Night round, always reveal all enemies at the Castle when you move into a hex adjacent to the Castle.

Interact with a Site

Many map hexes contain a site. Sites are map features you can interact with using an Action. If the site is **required**, you *must* stop movement and immediately interact with it when you move into its hex. If a site is **optional**, you do not have to stop on its hex if you don't want to, and you are not forced to interact with it even if you do.

The different sites and how to interact with them are shown next.

Wandering Monster - *Required*
Enter combat with the monster enemy on the hex. Use the monster's printed values. Combat is explained on **page 24**.

Note that unlike fortified sites, you must place a random monster token on all wandering monster sites when the map card is revealed (even during setup).

Wandering Mage - *Required*
Enter combat with the monster enemy on the hex. Use the mage's printed values. Combat is explained on **page 24**. Note that unlike fortified sites, you must place a random mage token on all wandering monster sites when the map card is revealed (even during setup).

Crystal Garden - *Optional*
If you end your Turn on a Crystal Garden, gain 1 Crystal of your choice during Turn cleanup.

Healing Garden - *Optional*
If you end your Turn on a healing garden, heal 1.

Town - *Optional*
At a town, you may spend influence Points ( ) for any combination of 3 different purposes:

- ***Recruit Allies***: You may recruit an Ally from the offer by spending the required amount of influence per the Ally's printed cost. Tuck the Ally underneath the top edge of your Tracks Card. The Ally is immediately available to be used. You may recruit multiple Allies if you have capacity for them.
  - You must have capacity for the ally to recruit it. Your ally capacity is noted by your character's Level. You have capacity for 1 ally for every ally icon ( ) on your current level and all levels below it.
  - You may optionally disband an ally to free up capacity for recruiting a different one. To disband an ally, discard it from your hero area, to the bottom of the appropriate monster token stack.
- ***Heal***: For every 2 Points of influence spent, you may heal 1.

- ***Purchase Crystals***: For every 2 Points of influence spent, you receive 1 Crystal of your choice.

Caravan - *Optional*
At a caravan, you may spend influence ICON for any combination of 2 different purposes:

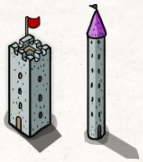

- ***Recruit Allies***: You may recruit an Ally from the Offering by spending the required amount of influence per the Ally's **printed influence cost plus 1**. Tuck the Ally underneath the top edge of your Tracks Card. The Ally is immediately available to be used. You may recruit multiple Allies if you have capacity for them.

- ***Purchase Crystal***s: For every Point of XP spent, you receive 1 Crystal of your choice (max of 3).

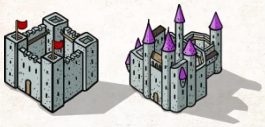

Storm – *Required*
When in a hex with a storm, you must spend 2 movement (in addition to the movement needed for your destination hex) before you can leave the hex. Spending this 2 movement is known as *escaping* the storm. Once you escape from a storm, you do not have to escape it again--unless you move out of and back into the storm's hex again.

After escaping a storm, you may spend extra movement for XP, but only if you then have enough to immediately level up. Earn ***n***-1 XP, where ***n*** is the extra movement spent.

Monster (*left*) or Mage (*right*) Tower – *Required*
If at any point you are adjacent to a tower during the day, place the top enemy from the matching stack into the tower. If you enter a Tower space at night, and there isn't already an enemy that was populated during the day, draw the top enemy (based on the Tower type) and begin combat.

Tower enemies have double the token's printed HP and double the token's printed Attack, and are **fortified**. When defeated, the Tower enemy provides the higher (upside down) XP reward.

Monster (*left*) or Mage (*right*) Castle – *Required*

Face enemies based on your difficulty setting (see **page 5**). You may face some combination of Wandering enemies and Tower enemies. Remember: Tower enemies are fortified, have double attack and health, and provide the larger XP value) and Wandering enemies are not.

Tunnel – *Optional*

Pictured on the left are Tunnel Gates. They allow you to travel underneath a hex (essentially skipping the hex) using a tunnel. You may move from a hex with a Tunnel Gate to another hex with a Tunnel Gate, traveling underneath a maximum of 1 hex. In other words, you can't use the tunnel to jump across the map to an unconnected Tunnel Gate. Tunnels always only allow you to skip 1 single hex.

To travel through a tunnel, spend ***X*** movement, where ***X*** is the movement cost of the hex moved into at the other end of the tunnel (<u>not</u> the hex you skipped over).

After doing this, immediately roll the Crystal Source Shard to determine what you encounter in the tunnel. **If you roll a " / " use the shard on the left.** After seeing your result, return the Crystal Source Shard back to the state it was in before rolling it.

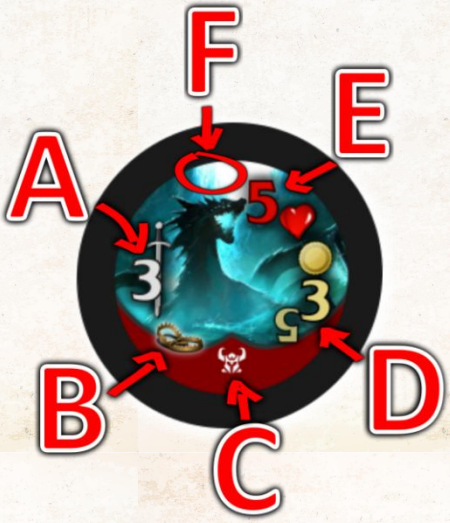

- **Purple**: Mage Tower Enemy
- **Blue**: Monster Tower Enemy
- **Black**: Peaceful, albeit creepy, darkness. You encounter no trouble.

If you defeat the enemy (or rolled a Black Crystal) proceed to the exit hex. If you did not defeat the enemy, either retreat to the entrance hex OR choose to progress to the tunnel exit. If you choose to progress, the enemy attacks you again: you must take additional wounds based on the enemy's attack value (ignoring enemy Abilities). These wounds are in addition to any you suffered during the combat. You cannot block this extra attack; you must take the wounds if you choose to progress.

Combat

Throughout your adventures you will encounter various enemies. If you move into a hex containing an enemy, you must enter combat with it.

Enemy Token Anatomy

A) Attack stat

B) Ability icon(s)

C) Monster (, red) or Mage (, purple) icon

D) XP reward. The right-side-up value (3 in this case) is if you defeat this token as a Wandering enemy. The upside-down value (5 in this case) is for if you defeat this enemy as a Tower enemy.

E) HP stat

F) Resistance icons (,), if any (this enemy does not have Resistance).

Wandering vs. Tower Enemies

Wandering and Tower Enemies use the same enemy tokens, but you make some modifications to their stats and XP rewards depending on which type the token is.

Enemy tokens on Wandering Monster or Mage sites are always **Wandering Enemies**. Wandering Enemies simply use their printed stats; you need not

make any modifications to their stats while in combat with them. If you defeat a Wandering Enemy, you gain its right-side-up XP reward.

Enemy tokens on Monster or Mage Tower sites are always **Tower Enemies**. Tower Enemies are more challenging than Wandering Enemies. These are the differences:

- Tower Enemies have double their printed HP and attack stats.
- Tower Enemies are always Fortified (see **page 38**).
  - If a Tower Enemy has the printed Fortified Ability, it is considered Double Fortified. You are not allowed to defeat it in the Ranged Phase, even if your Ranged attacks have Precision (see **pages 15** and **38**).
- When defeated, Tower Enemies provide the token's upside-down XP reward value.

Depending on your difficulty setting, you will face some number of Wandering or Tower enemies at the Castle--or even some of each. Follow the instructions on your difficulty setting when this time comes.

Combat Phases

Combat has 4 phases. Resolve them in order:

1. Ranged Attack Phase
2. Block Phase
3. Melee Attack Phase
4. Resolution Phase

1. Ranged Phase

In the Ranged Phase, you can use Ranged Attacks (and generated from Abilities, Skills, and/or Allies), which gives you the potential to defeat the enemy before they have a chance to attack.

If the enemy has Physical Resistance ( ), you must halve the Physical attack Points ( ) you use against it. If the enemy has Magic Resistance ( ), you must halve the Magic attack Points ( ) you use against it.

If you can generate enough ranged attack equal to or greater than the enemy's HP, you defeat it. Proceed directly to the Resolution Phase.

If you did not defeat the enemy in the Ranged Phase, proceed to the Block Phase.

2. Block Phase

The enemy will now attack you using its attack stat. You must either block the attack or take wounds.

If you spend Block Points equal to or greater than the enemy's attack value, you have successfully blocked the attack. Proceed to the Melee Attack Phase. You are not required to spend any Block Points in this phase; you can choose to simply let the attack through and take wounds if you want to.

Important: Blocking is all or nothing. You must block the full amount of the enemy's attack for the block to be successful. If you are short even 1 Point, the block is unsuccessful and the enemy's full attack gets through.

If the block was unsuccessful, you must take wounds.

TAKING WOUNDS

To take wounds, first determine how many you must take by comparing your Armor stat with the enemy's Attack stat. Your current Armor stat is found by looking at your current hero Level, on the top-right corner of the Level box. In the image on the right: if this was your current hero Level, you can see you have an Armor stat of 3.

Divide the enemy's Attack stat by your Armor value to find the number of wounds you receive. If there is any remainder, round up to the next whole number.

For example, if the enemy's Attack is 7 and your Armor is 3, you'd calculate it as: 7 divided by 3 equals 2.33. You round up to the nearest whole number to land at 3. Therefore, you must take 3 wounds.

For every wound you must take, shift the wound marker on your Wound Track leftward 1 space. The example on the right shows what it would look like to take 3 wounds if you had been at full health, with the wound marker starting in the rightmost space on the Wound Track.

If you take a Wound that pushes the Wound marker onto or past the Turn space your Turn Marker is on, it means this is your last Turn of the Round (see **page 31**).

If you take enough Wounds to push the Wound marker **past** the Turn space your Turn marker is on, you must take **additional Wounds**! For every Turn space your Wound marker has moved beyond where your Turn marker currently is, you must take 1 additional Wound (after taking all your normal Wounds). This rule is typically most relevant during Castle combat (see **page 33**), in which you are facing multiple enemies and have the potential to take a large number of wounds.

If your Wound marker ever moves into the leftmost space of the Wound track, you lose the game immediately.

Wounding Allies: You can wound ready or exhausted Allies to soak up some of the enemy damage for you. If you fail to block an enemy's attack, you may move one or more Allies to the left side of your Tracks Card (the Wounded area) to wound them. Then, reduce the enemy's attack by the HP(s) of the Ally(s) you wounded. Your hero then takes wounds based on whatever attack was not soaked up by wounding the Ally(s).

HEALING WOUNDS

Some effects in the game provide Healing, such as ending your turn on a Healing Garden or using certain Skills. Healing is how you get rid of Wounds. For every Point of Healing you spend, move the Wound marker rightward one space.

You may heal an ally by spending Healing Points equal to half their HP stat, rounded down.

EFFICIENT AND INEFFICIENT BLOCKS

All enemy attacks and blocks have a type: Physical or Magic. Monsters ( ) deal Physical ( ) attack, and Mages ( ) deal Magic ( ) attack.

If a block type matches the attack type, then the block is considered to be Efficient. This means the block gets to block at a 1:1 ratio; that is, 1 Point of block gets to block 1 Point of enemy attack. Physical block ( ) is Efficient against Physical attack ( ), and Magic block ( ) is Efficient against Magic attack ( ).

If the block type doesn't match the enemy attack type, then it is Inefficient. It requires 2 Points of Inefficient block to block 1 Point of enemy attack.

It's possible you will spend different types of block (some Physical and some Magic) to block an enemy's attack. This is allowed, but you still must abide the rules about Efficient and Inefficient blocks. Deal with the two types of block separately in terms of halving them for Inefficiency or not.

For example, let's say you are facing a Mage enemy with 4 attack. Since it is a Mage enemy, it deals Magic attack. You use an Ability to generate 2 Magic block, and then use another Ability to generate 4 Physical block. This is just enough for a successful Block. The 4 Physical block is Inefficient against the enemy's Magic attack, so it requires 4 Points to block just 2 attack. The Inefficient Physical block (for a modified 2 block) and the Magic block (for 2 Efficient block) add up to the 4 block you needed for the attack.

3. Melee Phase

Whether you successfully blocked the enemy's attack or not, you now move on to the Melee Phase. You must spend attack Points equal to or greater than the enemy's HP to defeat it.

In the Melee Phase, you are allowed to use Ranged attacks. You can even use a combination of Ranged attack Points and Melee attack Points.

If the enemy has Physical Resistance (), you must halve the Physical attack Points ( , ) you use against it. If the enemy has Magic Resistance (), you must halve the Magic attack Points ( , ) you use against it.

If you defeated the enemy, place its token to the right of your Abilities Card. This token is now saved as XP. If you defeated a Tower Enemy, rotate the token upside-down when saving it as XP to denote that you get the larger, upside-down XP reward. If you now have enough XP to level up, you may do so (see leveling up on **page 29**)

If you could not spend enough attack to defeat the enemy, you have lost the combat. You must retreat, which means moving your hero token to the hex from which you moved into the enemy's hex. The enemy token remains in its hex. If you fight it again, it starts with its full HP and stats as normal; it recovers completely between combats against it.

Level Up

Throughout your journey you will earn XP, typically by defeating enemy tokens. Enemy tokens you defeat are saved as XP by placing the token on the right side of your Tracks Card. You can spend XP the level up your hero. You can do this any time you are not in the middle of resolving a different action (such as a combat).

Your hero Level is the space on the Level Track that your Level marker is currently on. Each Level square states the level number inside the green wreath icon in the middle of the square ( ). You start on Level 1 and could increase all the way up to Level 8.

To level up, spend XP equal to the cost of the next hero Level to the right. The cost is in the gold XP icon on the top-left of every Level's square. You cannot make change when spending XP to level up. Any XP token you spend is spent for its full XP reward; you can't spend some and save the rest. If you spend more XP than is needed for leveling up, any excess XP is lost.

In the example below, you can see moving from Level 1 to Level 2 costs 3 XP. After paying the appropriate cost, move your hero marker to your new Level's square. Going from Level 2 to Level 3 would cost you 5 XP.

You may gain a number of benefits from increasing your hero Level:

- Your Armor ( ) may increase. Note the Armor stats on the top-right corner of each Level square.
- If your new Level shows the + icon, it means you have 1 additional Ally capacity. You do not gain Allies for free; you still must go recruit them at a site that allows you to do so.
- If your new Level shows the + icon, gain a new skill immediately. Choose a skill token from the offer to place below your Tracks Card. Your new skill is immediately active and ready to be used. Refill the offer after taking a skill.
- You may unlock new Abilities with a new hero Level. Your Level dictates which arrow colors you may follow on your Tracks Card (and, therefore, which Abilities you have access to). The Level square's colored border tells you which arrow colors you have unlocked. You begin with only yellow arrows (Levels 1-2), unlock white arrows at Level 3 (Levels 3-4), and unlock green arrows at Level 5 (Levels 5-8). You don't lose access to arrow colors you previously had as you unlock new arrow colors.

Advance

You may use any number of your 3 Abilities on your turn to simply Advance your Ability marker to a new connected Ability square without resolving the Ability. This is typically sub-optimal because it wastes one of your 3 Ability uses, but sometimes you may find it necessary.

Note that some skills may give you a free Advance of your ability marker. These do not count as one of your 3 Ability uses for your turn.

Turn Cleanup Phase

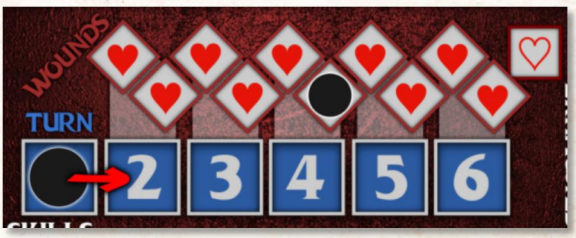

After you are done taking actions on your turn, follow the steps below for the Turn Cleanup Phase. You are free to end your turn voluntarily, even if you had more actions you could have taken.

Turn Cleanup has 4 steps:

1. Reroll the Crystal Source shard if you used it, and put it on the left side of the Ability Card so the Source is ready for next Turn. If you didn't use a Source Crystal this turn, leave the shard as it is.

2. If you ended your turn on a Healing Garden, you may heal 1 now. If you ended your turn on a Crystal Garden, you may gain 1 Crystal of a color of your choice now.

3. Move your Turn marker on the Turn Track one space to the right (see image below).

4. Check for end of round. There are 2 conditions which may end the round. If you meet either condition, proceed to the Round Cleanup Stage. The two end-of-round conditions are:
   a) Your Turn marker was on space 6 of the Turn Track this turn (there is a maximum of 6 turns per round; there is no space 7 to advance to).

b) The space you moved your Turn marker into on the Turn Track is blocked by the Wound marker. The Wound marker blocks a Turn space if it is far enough leftward on the Wound Track to be in the leftmost Wound space above the Turn space you would advance into. In the image above, you can see the hero has taken 5 wounds because the Wound marker has moved 5 spaces to the left on the Wound Track. The Wound marker is now in a position above the 4 space on the Turn Track (the rightmost space above the 4 in the Turn Track, not the leftmost space above it). Since in this example you are advancing the Turn marker from the Turn 1 space to the Turn 2 space, this does not trigger end of round. Likewise, the round would not end if you advanced the Turn marker from the 3 space to the 4 space, because there is still an empty Wound space above the 4 space on the Turn Track. If you had just taken your 4th turn, however, this would trigger end of round because the wound marker is to the left of the 5 space on the Turn Track.

You can think of Turns and Wounds as opposing tracks. Turns start from the left and Wounds start from the right. When these two tracks cross, that is what triggers end of round.

Once end of round is triggered, move to the Round Cleanup Stage.

Round Cleanup Stage

Follow these steps during Round Cleanup:

1. Advance the Round marker on the Round Track one space (shown below). Each round is half a day, and the numbers in the spaces of the Round Track indicate which day it is. Note that advancing the Round marker will move you from a Day Round (☀) to a Night Round (☾), or vice versa. **If you advanced past your Round limit (based on your difficulty setting), the game ends and you lose!**

2. Reset the Turn Track by placing the Turn marker on the Turn 1 space.

3. Refresh the Crystal Source Shard by rolling it and placing it on the left side of your Ability Card. Do this whether the Source Crystal had been used this turn or not.

4. Refresh the Offer. Flip existing Offer tokens to their enemy side and put them on the bottom of their appropriate enemy stacks. Then, populate the Offer with 3 new Ally/Skill tokens. Remember, for each Offer token you populate, take it from the enemy stack that appears to have more tokens in it (you can estimate this; the point is simply that you do not run out of one type of enemy or another).

5. Finally, refresh all your exhausted Allies and Skills so they can be used again in the next round. Refreshing Skill tokens moves them below your Tracks Card, and refreshing Ally tokens moves them above your Tracks Card.

After performing Round Cleanup, you are free to begin your first Turn of the next Round. Keep playing Rounds until…

- You win by defeating all enemies at the Castle
- You lose by running out of time or by taking the final (leftmost) Wound on the Wound Track.

Castle Combat (Multiple Enemies)

When you move into a hex adjacent to the Castle, you reveal all enemy tokens at the Castle. The number of enemies you face -- and whether they are Wandering or Tower enemies or some combination of the two -- is determined by your difficulty setting.

While in combat with multiple enemies, complete each combat stage (Ranged, Block, Melee) for all enemies before moving on to the next phase.

By default, treat each enemy individually. You are not allowed to block or attack multiple enemies at once.

Another way to explain it: For each phase of combat, you must generate Points to deal with 1 enemy, spend those points, and then move on to the next enemy. Points generated for one enemy cannot be applied to a different enemy, even if you have surplus Points remaining after dealing with a given enemy.

The exception to this rule is you are allowed to **group** enemies when attacking them, whether in the Ranged Phase or Melee Phase. Grouping enemies for the Block Phase is not allowed; you must deal with each enemy's attack separately.

You can choose which and how many enemies to group. Not all enemies in the combat must be included in the group.

When you **group** enemies, combine their HPs and deal with just the new sum total HP. Generate and spend attack Points for these multiple enemies as if this was now a single enemy's HP you were dealing with.

For example, if you group two enemies, one with 4 HP and the other with 5 HP, it is now as if you are facing a single enemy's HP of 9 HP. You must defeat this 9 HP in the normal all-or-nothing fashion to defeat the two grouped enemies.

If any enemies in the group have Physical Resistance, all your Physical attacks against this group are halved.

If any enemies in the group have Magic Resistance, all your Magic attacks against this group are halved.

If any enemies in the group have the Fortified ability, you cannot attack this group during the Ranged Phase (remember, the Castle is already a Fortified site. An enemy at a Fortified site that also has the Fortified ability cannot be attacked during the Ranged Phase, not even using Precision).

You will likely end up taking Wounds from some enemies and blocking others. You may also end up defeating some enemies and not defeating others. Save defeated enemy tokens for their XP reward as normal. You cannot level up during a combat, but you may level up after the combat if you have enough XP.

If you defeat all enemies at the Castle, you win the game immediately!

If you did not defeat all enemies at the Castle, you must end your turn and retreat to the hex from which you approached the Castle. If are not out of time, you can move back into the Castle hex next turn to take on the enemies you have not yet defeated.

Optional Variant: Bonus Map

Experienced players may want to add more variety to their games using the optional Bonus Map. The Bonus Map is found on the inside of the Cover Mat component. You will need to unfold and flatten the Bonus Map so it can rest flat on the table.

When playing with the Bonus Map, you will add it to the game during setup. There are two configurations for laying out the bonus map, which will be explained on **page 37**. You can choose which configuration you want to play with, in addition to which side of the main map you'll place the Bonus Map.

Playing with the Bonus Map opens new spaces to travel to on your journey. You may find this makes the game harder (possibly depending on which configuration you choose) because, depending on the route you take, you may have more ground to cover to reach the Castle.

By default, playing with the Bonus Map is intended to be more difficult for that reason. In a standard game with the Bonus Map, do not increase your Round limit.

You may, however, want to play with the **Bonus Map Adjusted Game Length** to create a more manageable challenge:

- Face the number and type of enemies as your difficulty setting dictates, but give yourself 1 additional Round in your Round limit.

Interacting with the Bonus Map

The Bonus Map behaves just like the map cards you are used to in the normal game. You can move from hex to hex and interact with Sites like you normally would.

The Bonus Map will be placed adjacent to the main map on either the left side or the right side. The outermost hexes on the main map and the Bonus Map are considered to be adjacent to each other. Let's call these pairs of connecting hexes **Bridges**. The only way to get from the main map to the Bonus Map (and vice versa) is by crossing one of these Bridges.

There will be empty black spaces between the main map and the Bonus Map. Let's call these **Pits**. You cannot move into Pits, but you can utilize Tunnel Gates to move underneath Pits using the normal rules regarding Tunnels.

One unique feature of the Bonus Map is a Monster Tower residing in a hex with Lake Terrain. The only way to enter this hex and interact with this Tower is if you have a Skill that allows you to move into Water spaces.

Exploring and the Bonus Map

Regardless of which configuration of the Bonus Map you chose to play with, the Bonus Map does not change positions during the game.

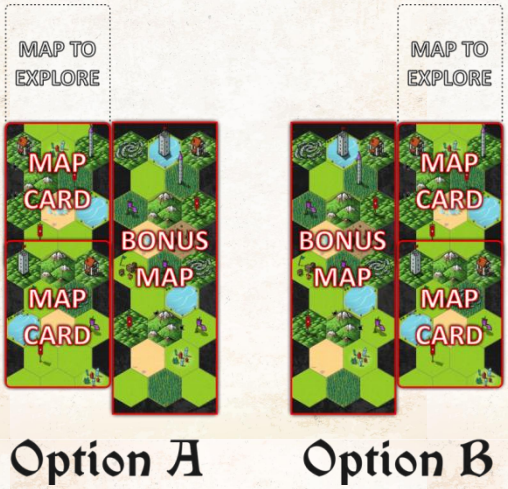

You can explore to reveal a new Map Card while at the same position as with the normal rules: on a Northern-most full hex on the second Map Card. You cannot explore and reveal a Map Card in a different place, such as on the Northern edge of the Bonus Map. But you are allowed to explore a Map Card in its normal position, but from an adjacent hex on the Bonus Map.

When you explore and reveal a new Map Card, place it as normal, tucking it underneath the existing Map Card. The newly-placed Map Card will have hexes adjacent to hexes on the Bonus Map, giving you new places to cross between the main map to the Bonus Map.

Bonus Map Configurations

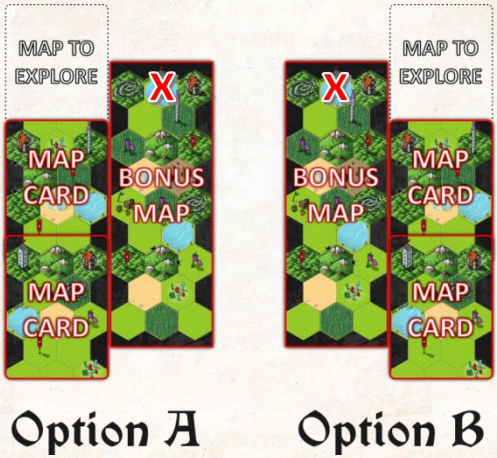

CONFIGURATION A:
THE LOST REALM

Star the game on one of the Southern-most hexes of the Bonus Map. You will need to cross into the Main Map at some point to be able to reach the Castle. You are not allowed to cross into one of the half hexes on the Southern border of the first map card. Otherwise, you may cross Bridging hexes as normal to go from the Bonus Map to the main map.

CONFIGURATION B:
THE SIDE QUEST

For normal difficulty, give yourself +2 Rounds to complete the game (including the +1 Round for the Bonus Map Adjusted Game Length). Start in one of the Southern-most half hexes on the first Map Card. Position the Bonus Map as shown, choosing to either place it on the right or the left of the main map. You are allowed to enter the Mini Boss's hex (marked with the "X") for a Move cost of 2 if you discard a Skill. Face a tower enemy as normal at the Mini Boss's hex. After defeating the Mini Boss, collect the XP and also keep it as an Ally (it does not count against your Ally limit). You can exhaust this Ally to use its Attack, and may Wound it to soak damage.

Enemy Abilities

Aggressive: It requires double the block Points to block this enemy's attack value.

Deadly: If you do not block this enemy's attack, flip your Wound marker to the injured (red) side. While you are injured, you must take 1 automatic wound during the Block Phase of every combat until you heal the wound. This is in addition to any other wounds you make receive during the combat. You may heal the wound by spending 1 healing and flipping the Wound marker back to its uninjured (black) side.

Fortified: You cannot attack this enemy during the Ranged Phase unless your range attacks have Precision ( ). If the enemy has the Fortified ability and is also on a Fortified Site (Towers, Castle), the enemy is considered Double Fortified. Double Fortified enemies cannot be attacked under any circumstances in the Ranged Phase; not even if your ranged attacks have Precision.

Unfortified: This enemy is not Fortified, even if in a Tower or Castle, or grouped with a Fortified enemy.

Flying: This enemy cannot be attacked in the Ranged Phase unless your ranged attack has Precision ( ). All non-ranged attacks against this enemy in the Melee Phase are halved.

Poison: If you do not successfully block this enemy, it deals twice its attack value.

Slow: You may spend movement Points as if they were block Points to block this enemy. You may use a combination of movement and block Points if desired.

Trap: If you do not successfully block this enemy, immediately advance your Turn Marker one space. Take 1 wound for every space on the Turn Track this pushes you past your limit.

Skills

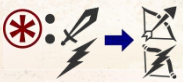

Once a turn, gain 2 Physical or Magic block.

Once a turn, change 1 block Ability or 1 Ally block effect from Physical to Magic, or vice versa.

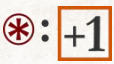

Exhaust this Skill to double the value of a block Ability or Ally block effect.

Exhaust this Skill to make all your melee attacks ranged this turn (whether Magic or Physical).

Exhaust this Skill to heal 2.

Exhaust this Skill to get 1 extra Action this turn.

Spend an Action to give all your range attacks Precision this turn.

Once a turn, advance your Ability marker 1 space without it counting as one of your Ability uses (don't resolve the Ability's effect).

You may move into Lake Terrain hexes for 2 movement Points. If you end your turn on a Lake, gain 1 Blue Crystal.

Exhaust this Skill to give all your range attacks Precision this turn.

Exhaust this Skill to gain 1 of the shown Crystal Color (there is a version of this Skill for each Crystal color). You may also advance your Ability marker without it counting as one of your Ability uses (don't resolve the Ability's effect).

You may move into Mountain Terrain hexes for 2 movement Points. If you end your turn on a Mountain, gain 1 Black Crystal.

Once a turn, gain Physical Block 2 or Move 2.

Exhaust this Skill to ignore 1 Ability on 1 enemy this turn. (Remember that Resistances are not enemy abilities).
